CHAPTER 6
CONCLUSION

From the chapters that have been made, it can be concluded that the process of insert, search, and delete are three important points for managing a series that form the binary tree visualization. In making visualization in PHP then it takes some objects that have various forms and can be assembled in a binary tree image (GD Library).

The advantages of this program are; can help the user to understand what visualization is and what a binary tree is, this program can facilitate the user in understanding and managing the binary tree, can help an educator in explaining the binary tree to the community, and Can be used in computer science learning.

The disadvantages of this program are; the program is still created manually, the program has certain limits in the input process, and page views for user interaction is still simple.
