

CHAPTER 6

CONCLUSION

6.1 Conclusion

From Implementaion until testing this project, it can be concluded that

1. Finite State Automata is able to seperate words into syllabels based on javanese language stucture's rule..
2. From the testing, this system can seperate word very accurately using finite state automata.
3. The amount of letter have big impact to the amount of time to process.

6.2 Future Research

This project only sound the number output from javanese language. We hope that in the future research this project not just sound the number but the entire syllabels of javanese language to perfected this project.
