ABSTRACT

A company needs to take an advantage of the development of computerized technology in processing data such as attendance data and remuneration. It is intended to advance the company. Using a manual process of remuneration, there is a big possibility that can result errors when arrange the payment check. Therefore, a company needs a program that can minimize repeated errors and inrease a processing time of remuneration data with this program.

Employees remuneration using hash table data structures can generate an employee roll that contain an accurate data, so it can increase the trust of employee in the company. This program use C programming language and hash table data structure. With that data structure, it can simplify the process of adding, deleting, and searching an salary data.

Remuneration employee program will produce an easiness on processing data for remuneration division and give an easiness to many employees for accessing the payment earned each month

Keyword: remuneration, C programming language, hash table

PREFACE

This program is intended to advance a company by give an easiness to employees when access the earning in detail. With using this program, it will increase the accuracy of the employee payment results for each months.

This report divided by six chapter. In the first chapter, it contains about the background of the title, scope that given during the first review, and objective. On chapter 2, it contains list of research that have been done by other people. On chapter 3 contains of several steps to complete this program in detail. In chapter 4 contains about analyze the problem to be solved and diagram as a solution to complete the problem. The fifth chapter discuss about implementation that contains important source codes and test results from the algorithm and data structure that applied on this program. And the last chapter on this report is chapter six, it contains of the conclusion and suggestion for other researchers.
