CHAPTER I

INTRODUCTION

1.1 Background

The various offices and businesses have already used the technology of computer servers. A computer server is a CPU with database and website inside. The server works to serve client requests; Its service are named as sql server and website server. This project setup sql and website server from client using webmin and phpvirtualbox. Database is with a computer server, then the work will be structured as using a major network that can access and monitor data in each job. Computer server serves to organize the data and any network client that run.

1.2 Scopes

By using the server, it is necessary settings can be accessed through the same local network using another computer, usually called a remote server and the client. So it does not necessarily have to do the network settings of the main server, but it can be done on the local network that are within the network.

1.3 Objective

By using the remote server and the client, it will facilitate and accelerate the user to pass settings and accessing the data server using other computers in the same network.
