

CHAPTER VI

CONCLUSION AND FURTHER RESEARCH

6.1 Conclusion

This final project is found beberapa problem owned by the server computer, which is about the RAM memory capacity is less and less stable LAN network. This problem resulted in the performance of the server itself is not optimal and often have disconnected networks, as well as the processing time is relatively long.

In addition to some of the problems, it turns out there is something valuable to be learned and understood from the final project. That is if you want to create a remote server, the server computer must have a specification that is quite high and the Internet and local networks are stable so that the performance of the server computer better.

6.2 Further Research

To use a remote server, then it needs to be delivered by the author is required learning about the remote server, in order to better know and understand how to run it.
