

## CHAPTER 6

### CONCLUSION

From the results of the project it can be concluded that R programming can read sales data, sales data processed in the form file data. From files can be processed and can see data types from sales files. In the process of statistical calculation in the R programming syntax it is made easier to use. Calculations are processed with scripts that already exist in R programming. Calculations in monthly sales are calculated per month and the processing results can be processed with other months, so that you can see calculations in one year.

The process results can be converted into a graph, so it is easier to know the ups and downs of sales revenue. For future research, it is recommended to do calculations by displaying the data that is lightened in the CSV file.
