

## CHAPTER 6

### CONCLUSION

In the project the Badminton Court Reservation System Using First Come First Served Method is a function in sorting it. So it can facilitate checking data from beginning to end.

Project System for Badminton Court Reservation Using the FCFS Method can solve the problem with a percentage value of 90.5% success rate, at the level of data ordering. The disadvantages of this project are that the FCFS method still cannot sort the time that was previously booked so that the data still appears in the next ordering data, in this project or the badminton court reservation system using the FCFS method and hopefully it can be developed in the next project to be better.
