# CHAPTER 6

## CONCLUSION

The conclusion in this project from the two sensors is for the purpose of infant safety is quite efficient. Because the response in every sensor is very fast. When the sensor sends the parent can immediately see the baby who has awakened. Apart from being safe and sending a signal to his parents. The two sensors can also be used to record the baby's sleep time. From the recording of the data obtained, parents can also find out the average time the baby needs to sleep in a day. In this project there are still many shortcomings. Uneven sensor distance accuracy. Can later for the continuation of this peroject can replace it with a more optimal sensor. In this project can be developed again in the data collection process to process the data to analyze the baby's sleep time. Until every day parents can always control their baby when busy even though.
