

CHAPTER 6

CONCLUSION

From the design, implementation and testing that has been done regarding the parking monitoring system, it can be concluded that this tool has been successfully made and can function very well, such as:

1. The system can measure the height of the car well.
2. The system is informative.
3. The system can also make parking efficient.
4. The system can also direct the car to the nearest slot properly and correctly according to the calculation of the algorithm.

That way car users can minimize the time to find the nearest empty slot and with the different slots for each car, it makes car drivers more comfortable. For future suggestions, you can add more information that supports an informative system such as the layout or slot plan displayed on the monitor or LCD.
