CHAPTER 1 INTRODUCTION 1.1. Background Along with the times, technology has become an alternative in solving various problems. One of the results of technological developments is the creation of many applications and software that help many people. The basis of application or software development is the creation of software that can keep up with the times according to user needs and produce software that can increase the effectiveness and efficiency of a company, industry and independent business. From this statement, it's necessary to measure software by testing to produce superior quality software. The purpose of testing is that the software does not contain errors or bugs that can interfere with the performance of the software. There are two ways of testing that most people do, namely manual testing and automated testing. Testing manually is done by trying the menu, performance and overall features contained in the software. The test requires a lot of resources and time, This is because testing is carried out continuously in the
