CHAPTER 6
CONCLUSION

The tools and devices used make this research successful. This SMS gateway program runs well as designed. Step by Step runs smoothly. Each incoming SMS cannot be ascertained how long it will take, the most important thing is that when it comes in, it will autoreply to the user. More or less incoming SMS, sent 1-2 minutes.

Usually if the old SMS comes in due to the signal. When a student asks a question, it is certain that the student will get the answer that is expected. This system has been made as much as possible so that students can understand and can also share important information with all students. If at any time you want to share information only to a few groups, it could be that only the students concerned get the sms.

The design used also makes anyone who runs it easy to understand and elegant. This system has also been made stable using Gammu version 1.42.0 and a quality modem. This program has also been tested by researchers is successful and accurate so that it can be used anytime.

For future research, the range of answers will be expanded so that students can ask anything doesn't matter of schedule. Use a modem that is really healthy and proper to use. If will hinder the test because once the SIM Card is not detected it will take a long time. Also make sure the number used has credit and is active. Data security in the future can be more secure and can be in the playstore.
