

CHAPTER 6

CONCLUSION

The conclusion that can be drawn is that Orange can use the car price dataset. Orange can also predict car prices with the K-Nearest Neighbors (KNN) and Random Forest algorithms. The results of 70%, 80%, and 90% of the data show that the K-Nearest Neighbors (KNN) algorithm has predictions that are closer to the target than the Random Forest algorithm.

Further research can be supplemented by using methods such as Cross Validation. Using other algorithms besides K-Nearest Neighbors (KNN) and Random Forest. The car price dataset can be retrieved on Kaggle, for different datasets, you can use existing datasets on Kaggle or other sources.
