

CHAPTER 6

CONCLUSION

Based on the results of this project are:

1. Successful install ISP config in operating systems Kubuntu 16.04 using Apache web server, maria-db, and PHP myadmin.
2. ISP config works by adding a client in advance to accommodate the name of the website that will be created after it makes the DNS server that will be useful to open a Web page to the web browser.
3. Displaying the results from a web site via a web browser by way of calling the DNS configuration have been made in the ISP config and can post articles on wordpress to try database is running or not.

Advice in the development of this project are:

1. Use the ISP config as e-mail server and use SpamAssassin to filter incoming e-mail are including spam or not.
